**Demands** on state-of-the-art fused silica capillary GC columns:

- ✓ lowest column bleed for ultra trace analysis applications
- ✓ excellent signal-to-noise ratio for increased sensitivity
- ✓ suitability for ion-trap- and quadrupol-MS applications
- ✓ high temperature stability
- ✓ perfect inertness for basic compounds
- ✓ short column conditioning times (<2 h → „ready to use“)

MACHEREY-NAGEL is proud to introduce now:

## OPTIMA® 1-MS Accent

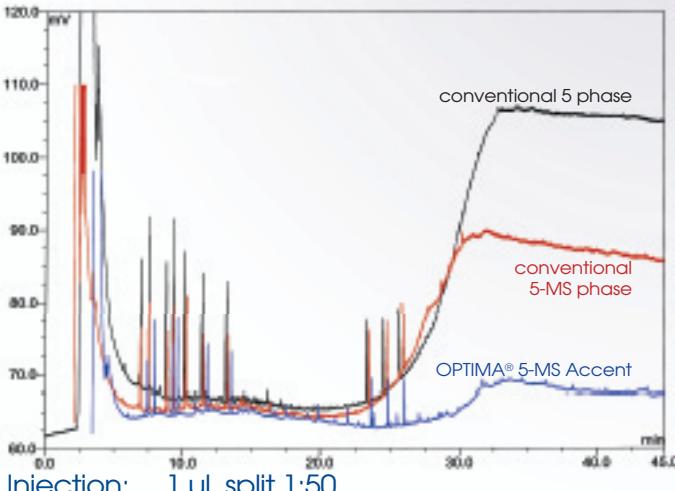

## OPTIMA® 5-MS Accent

## OPTIMA® XLB

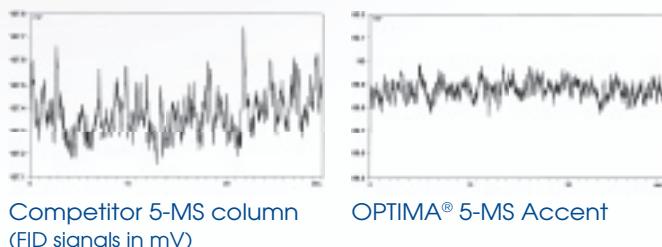

as three 100% ion-trap compatible ultra low bleed capillary GC columns  
based on silarylene technology.

**Lowest column bleed**  **reduced contamination of the detection system**  
 **improved detectability of solutes in trace analysis**

In a bleed comparison test between OPTIMA® 5-MS Accent with a conventional "5"- phase and a column designated explicitly as "5-MS", the outmatched performance of the silarylene phase can be shown.

The unmatched low background level of the OPTIMA® 5-MS Accent column which is approximately three times lower compared with a "5-MS brand" provides significantly increased sensitivity and allows the use for trace analysis applications particularly of high boiling compounds.

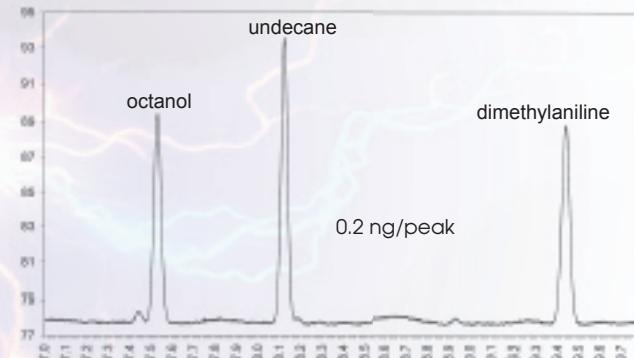

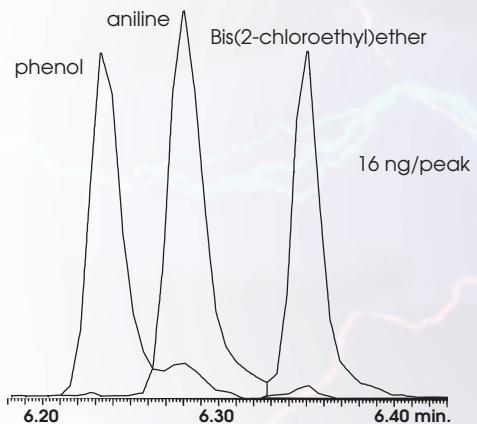

## High temperature stability ➤ extended column lifetime ➤ applicable for high boiling compounds

## Optimized tubing surface deactivation ➤ reduced tailing of polar compounds

OPTIMA® 5-MS Accent exhibits excellent peak shapes and – asymmetries for i.e. phenol, aniline or dimethylaniline even without previous derivatization.

## How to explain the differences between standard OPTIMA® 5, OPTIMA® 5 MS and OPTIMA® 5-MS Accent?

Basically all three stationary phases have identical polarity and from that also similar selectivity features provided that a calculated ratio of 5 % phenyl groups in the polysiloxane layer to all of the above mentioned phases. However on what are the differences based in terms of the column bleed? This can be explained by the different constitution of the phenyl rings in the polysiloxane ring structure.

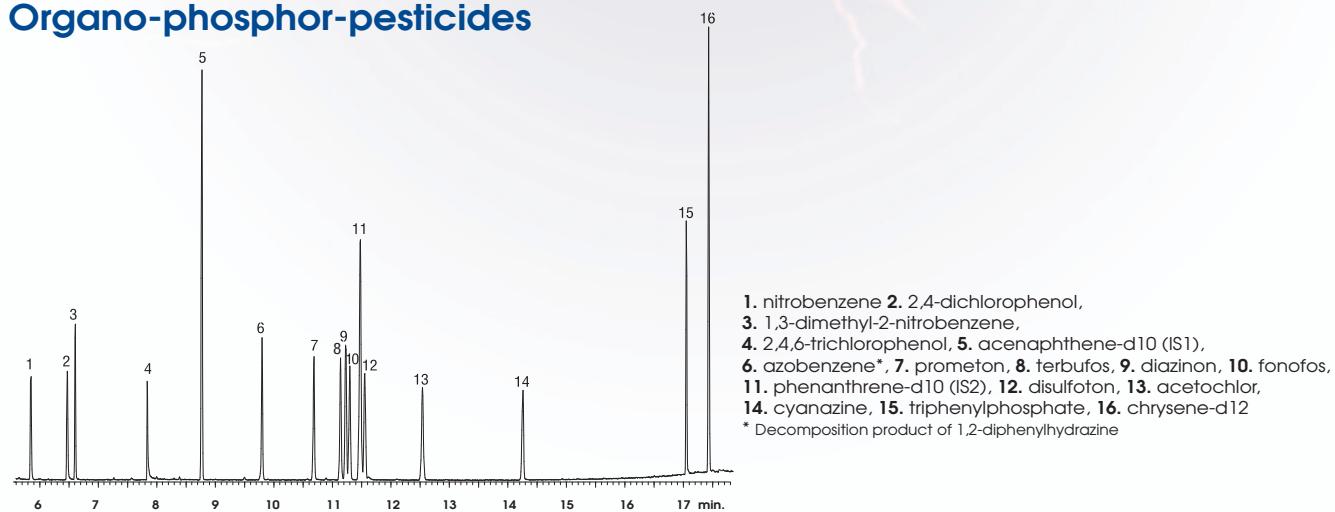

**OPTIMA® XLB ➡ larger ratio of phenyl rings ➡ slightly increased polarity**

**Improved thermal stability and significantly minimized column bleed has been attained by the insertion of arylene groups in the polymeric siloxane chain!!!**

**The following application examples exhibit the outstanding performance of the new OPTIMA® Accent columns and Optima® XLB**

## OPTIMA® 1-MS Accent / OPTIMA® 5-MS Accent / OPTIMA® XLB

- high temperature stability (340 °C for isothermally operated runs / 360 °C for short isothermal runs in temperature programmed GC), columns with film-thicknesses > 0.5 µm have temperature limits of 320 °C / 340 °C
- Very low bleed characteristics, non-polar phases, suitable for ion-trap detection systems
- Application areas: "allround" phases for environmental analysis, trace analysis, EPA methods, pesticides, PCBs, food and drug analysis

### OPTIMA® 1-MS Accent

Chemically bonded, cross-linked phase, polarity index according to 100 % Dimethyl-Polysiloxane

- similar phases: OV-1, DB-1 MS, SE-30, HP-1 MS, Ultra-1, SPB-1, CP-SIL 5 CB MS, Rtx®-1 MS, 007-1, BPX-1, MDN-1, AT™-1 MS, ZB-1, OV-101, VF-1 MS
- USP G 2

### OPTIMA® 5-MS Accent

Chemically bonded, cross-linked silylarylene phase, polarity index according to 5 % Diphenyl / 95 % Dimethyl-Polysiloxane

- similar phases: SE-54, SE-52, DB-5 MS, HP-5 MS, Ultra-2, Equity™-5, CP-SIL 8 CB low bleed/MS, Rtx®-5 SIL-MS, Rtx®-5 MS, 007-5 MS, BPX-5, MDN-5S, AT™-5 MS, ZB-5, VF-5 MS
- USP G 27, 36

### OPTIMA® XLB

Chemically bonded, cross-linked silylarylene phase with higher ratio of silarylene

- similar phases: DB-XLB, Rtx®-XLB, MDN-12, VF-XMS
